Summary

Computer Science undergraduate with a dual focus in backend systems and Android/cross-platform mobile development. Experienced in building secure, containerized backend infrastructure and production-quality mobile applications — from sandboxed execution engines to local-first Flutter apps with layered architecture. Strong foundation in scalable API design, distributed systems, and role-based access control, with a track record of shipping end-to-end across both the server and the device.

Education

VIT Chennai

B.Tech in Computer Science and Engineering

Expected: **2028**

CGPA: **8.66 / 10.0** (3.46 / 4.0) *Selected for DevsHouse Hackathon — Top 10% of 3,500+ applicants.*

Technical Skills

Languages: JavaScript, TypeScript, Dart, Kotlin, Java, C/C++

Backend: Node.js, Express.js, REST APIs

Frontend/Mobile: Next.js, Flutter, BLoC, Jetpack Compose

Databases: PostgreSQL, MongoDB, Firebase, Supabase

Tools: Docker, Git, GitHub Actions, Linux, Nginx, Redis, Prometheus, AWS, Oracle Cloud

Concepts: DSA, OOP, RBAC, CI/CD, Unit Testing, Distributed Systems, Clean Architecture, MVVM

Projects

Runnix — Sandboxed Code Execution Engine

TypeScript, Docker, gVisor, Redis, Prometheus

- Built a secure code execution backend supporting JWT auth, API key management, and role-based access control.
- Implemented Docker + gVisor sandboxing with hard memory (64MB) and CPU (0.5 core) limits per container.
- Designed Redis-based rate limiting (10–500 req/min) load-tested to sustain **200+ concurrent jobs**.
- Integrated webhook delivery with automatic retries and Prometheus metrics for runtime observability.

SwiftWrite — Local-First Cross-Platform Writing App

Flutter, Dart, BLoC, Hive, Firebase

- Built a local-first Flutter writing app with BLoC and Hive; Firebase cloud sync activates only on authentication, with full offline fallback.
- Structured with feature-sliced architecture and `get_it` + injectable DI; cloud services conditionally registered without blocking local-only mode.
- Implemented file-aware editing with live Markdown preview and authenticated code execution (Python, C) with health check, submit, and poll-to-result lifecycle.

Steal-CSS — Automated CSS Extraction Tool

Node.js, MongoDB, Puppeteer, Docker

- Built an automated pipeline to render, extract, and index website stylesheets with sub-200ms latency.
- Orchestrated multi-site browser workflows using Puppeteer, containerized for reproducible deployments.
- Eliminated manual CSS extraction for target workflows; shipped as a self-contained Docker image.

WeDroid — Club Management App (Android Club, VIT)

Flutter, Supabase

- Developed a cross-platform app actively used by **100+ club members** for event and role management.
- Implemented role-based access control and real-time data sync via Supabase.

Leadership

Android Club, VIT Chennai — Technical Head

2026–Present

Responsible for technical decisions across a 100+ member club; currently establishing stack standards and onboarding junior developers onto ongoing projects.

Languages

Hindi (Native), English (Fluent), German (Beginner)
